Name: $\qquad$

## Solve each growth or decay problem.

1. For a period of time, an island's population grows at a rate proportional to its population. If the growth rate is $3.8 \%$ per year and the current population is 1543 , what will the population be 5.2 years from now?
2. During the exponential phase, E. coli bacteria in a culture increase in number at a rate proportional to the current population. If the growth rate is $1.9 \%$ per minute and the current population is 172.0 million, what will the population be 7.2 minutes from now?
3. Radioactive isotope Carbon- 14 decays at a rate proportional to the amount present. If the decay rate is $12.10 \%$ per thousand years and the current mass is 135.2 mg , what will the mass be 2.2 thousand years from now?
4. You invest $\$ 1,000$ at a rate of $3 \%$ compounded quarterly. What will your new balance be after 5 years?
5. You bought a Boston Whaler in 2004 for $\$ 12,500$. The boat's value depreciates by $7 \%$ a year. How much is the boat worth in 2012? What will it be worth in 2020 ?

State whether the formula models growth or decay, explain how you know.

1. $\mathrm{y}=3^{\mathrm{x}}$
2. $y=5 \times(0.5)^{x}$
3. $y=0.25^{x}$
4. $y=6 \times(1.01)^{x}$
5. $y=3 \times(0.033)^{x}$
6. $y=5.125^{x}$
